### TOPICS

This mini-symposium will be a forum for presenting and discussing the problems connected with numerical modelling of rocks and soils, including but not limited to:

- material models for rocks and soils at macro/meso/micro-scales,
- numerical simulations for rocks and soils under various deformation processes (creep, shrinkage, loading, temperature),
- interaction between subsoil and structures,
- interaction between rocks/soils and embedded/anchored structural elements,
- experimental testing of rocks and soils structural elements.
